Thought process behind the design

- After doing some research we found that the visually challenged use a tool called 'JAWS' which reads the text on a page. The issue with this tool is that the users find it difficult to follow what is going on when there are too many images, links and bullet points on the page. The visually challenged also use tab for navigation but we could not build that into this prototype.
- Keeping this in mind, we made our prototype without any of the above mentioned points. Also, we have used the whole page and kept it very minimal. We have color coded every section to make the website as easy to navigate as possible. Because of this, the whole section area is clickable, not just the text.
